Fire Research and Management Exchange System (FRAMES)

<http://frames.nbii.gov>

The goal of **FRAMES** is to provide a systematic method of exchanging information and transferring technology between wildland fire researchers, managers, and other stakeholders in order to make projects, tools, documents, data, and other information resources easy to find, access, distribute, compare, and use. Publicly accessible content on FRAMES is organized into three main areas:

- Subject Areas
- Geographic Areas
- Partner Sites

Photo credit: Zander Evans

Subject Areas: Find resources (i.e., data, documents, tools, projects, programs and web pages) organized by subject.

Geographic Areas: Find regionally significant information resources and tools that correspond to the U.S. Geographic Area Coordinating Centers (GACCs).

Partner Sites: Visit sites that are operated and maintained by partner projects and organizations in order to share pertinent data, publications, and other materials.

Southwest Fire Portal

The **Southwest Fire Portal** provides information about fire science and technology relevant to the southwestern contiguous United States. Our goal is to provide "one-stop shopping" for resource managers, decision makers, scientists, students, and communities who want access to the results of efforts to understand and manage fire and fuels on lands in the Southwest.

Through the Southwest Fire Portal you can access information about the **Southwest Fire Science Consortium**:

<http://frames.nbii.gov/southwest/consortium>

Visit the Southwest Fire Portal at:
